# An Introduction to Fractals with

python™

**Professor Stephen Lynch NTF FIMA SFHEA**

<https://www.lboro.ac.uk/departments/compsci/staff/stephen-lynch/>

**Definition 1.** A *fractal* is an image repeated on an ever-reduced scale.

**Definition 2.** A *fractal* is an object with non-integer dimension.

### Fractals in Nature

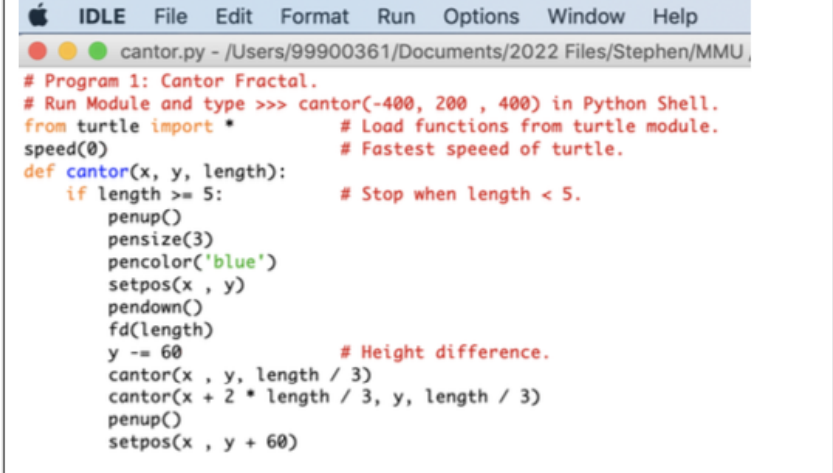

### Mathematical Fractals

### Example 1. The Cantor set (1870).

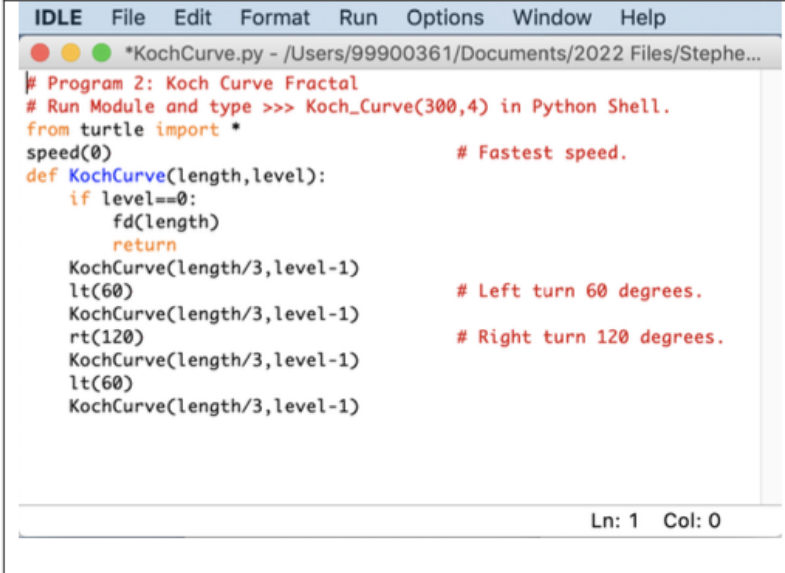

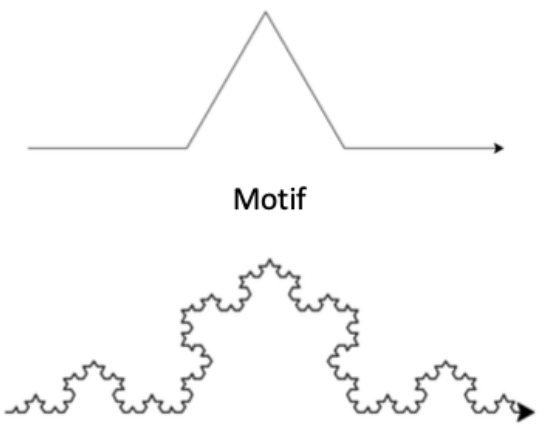

Start with a unit line segment and at each stage remove the middle third segment and replace one segment with two segments each of length one third of the previous segment.

 <pre># Program 1: Cantor Fractal. # Run Module and type &gt;&gt;&gt; cantor(-400, 200, 400) in Python Shell. from turtle import *      # Load functions from turtle module. speed(0)                  # Fastest speed of turtle. def cantor(x, y, length):     if length &gt;= 5:       # Stop when length &lt; 5.         penup()         pensize(3)         pencolor('blue')         setpos(x, y)         pendown()         fd(length)         y -= 60            # Height difference.         cantor(x, y, length / 3)         cantor(x + 2 * length / 3, y, length / 3)         penup()         setpos(x, y + 60)</pre>	 <p><b>Figure 1: The Cantor set to stage 4.</b></p> <p>To understand the program, set speed(1) and plot the Cantor set to stage 2. Mimic by-hand what the program is doing.</p>
--	---

**Problem 1:** Edit Program 1 to plot a variation of the Cantor set, where two segments (each one-fifth the length of the previous segment) are removed at each stage.

### Example 2. The Koch curve (1904).

Start with a unit line segment, remove the middle third segment and replace one segment with four segments each of length one third the previous segment, as illustrated below.

 <pre># Program 2: Koch Curve Fractal # Run Module and type &gt;&gt;&gt; Koch_Curve(300,4) in Python Shell. from turtle import * speed(0)                  # Fastest speed. def KochCurve(length, level):     if level==0:         fd(length)         return     KochCurve(length/3, level-1)     lt(60)                 # Left turn 60 degrees.     KochCurve(length/3, level-1)     rt(120)               # Right turn 120 degrees.     KochCurve(length/3, level-1)     lt(60)     KochCurve(length/3, level-1)</pre>	 <p><b>Figure 2: The Koch curve.</b></p>
--	--

**Problem 2:** Edit Program 2 to plot a Koch square curve, where one segment is replaced with five segments each one-third the length of the segment before.

**Example 3.** The *Sierpiński triangle* (1915).

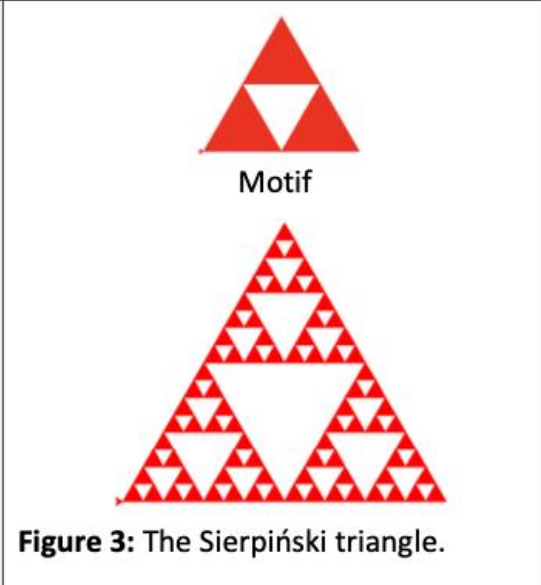

Start with a solid equilateral triangle and at each stage remove the middle-inverted triangle. Complete the construction up to stage 4.

File Edit Format Run Options Window Help

\*Sierpinski.py - /Users/99900361/Documents/2022 Files/Stephen/...

# Program 3: Sierpinski triangle - save file as Sierpinski.py.  
# Run the Module (or type F5).  
# In the Python shell, type >>> Sierpinski(400 , 5)  
from turtle import \*  
def Sierpinski(length, level):  
 speed(0) # Fastest speed.  
 if level==0:  
 return  
 begin\_fill() # Fill shape.  
 color("red")  
  
 for i in range(3):  
 Sierpinski(length/2,level-1)  
 fd(length)  
 lt(120) # Left turn 120 degrees.  
 end\_fill()

Ln: 1 Col: 0

**Figure 3:** The Sierpiński triangle.

**Problem 3:** Edit Program 3 to plot a Sierpiński square, where the middle square is removed at each stage. See one face of the Menger Sponge in Figure 4b.

**Example 4.** Use train tickets to construct stage 1 of the *Menger Sponge* (see Figures 4a and 4b).

**Problem 4:** Given that you need 6 tickets to make one small block:

How many tickets do you need for the stage 1 construction? (See Figure 4a).

How many tickets would be required for the stage 2 construction?

How many tickets would be needed for the stage 4 construction? (See Figure 4b).

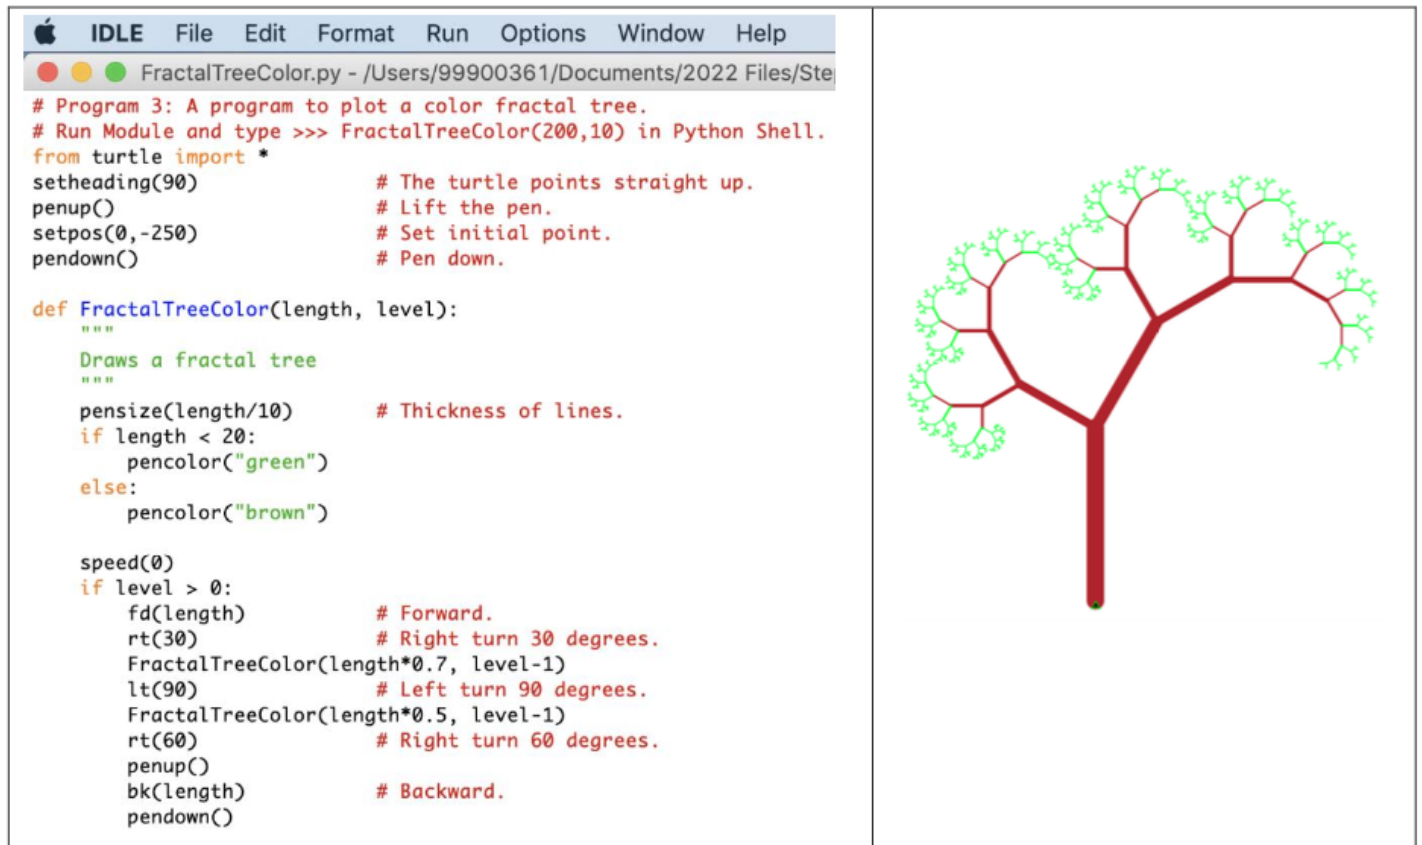

**Figure 4a:** Menger sponge, stage 1.

**Figure 4b:** Menger sponge, stage 4.

**Example 5.** A Python program for plotting a fractal tree.

**Problem 5:** Edit Program 4 to plot a trifurcating tree with three branches at each level.

The formula for working out the fractal dimension  $D_f$ , say, is

$$D_f = -\frac{\ln(\text{Number of segments})}{\ln(\text{Length scale})}.$$

The fractal dimension of the Cantor set is  $D_f = \frac{\ln 2}{\ln 3} \sim 0.6309$ .

The fractal dimension of the Koch curve is  $D_f = \frac{\ln 4}{\ln 3} \sim 1.2619$ .

The fractal dimension of the Sierpiński triangle is  $D_f = \frac{\ln 3}{\ln 2} \sim 1.5850$ .

The fractal dimension of the Menger sponge is  $D_f = \frac{\ln 20}{\ln 3} \sim 2.7268$ .

**Problem 6:** Work out the fractal dimensions of the other fractals.

One-day interactive workshops: Python for A-Level Mathematics and Beyond:

<https://ima.org.uk/events/conferences/> (one in winter and one in summer)

Python Books: (click on book)

### A Simple Introduction to Python (for complete novices)

#### Features:

- No prior experience in programming is required.
- Demonstrates how to format Jupyter notebooks for publication on the Web.
- Full solutions to exercises are available as a Jupyter notebook on the Web.
- All Jupyter notebook solution files can be downloaded through GitHub.

### Python for Scientific Computing and Artificial Intelligence (intermediate level)

#### Features:

- No prior experience of programming is required.
- Online GitHub repository available with codes for readers to practice.
- Covers applications and examples from biology, chemistry, computer science, data science, electrical and mechanical engineering, economics, mathematics, physics, statistics and binary oscillator computing.
- Full solutions to exercises are available as Jupyter notebooks on the Web.
